

# Vidyavardhini's College of Engineering and Technology Department of Artificial Intelligence & Data Science

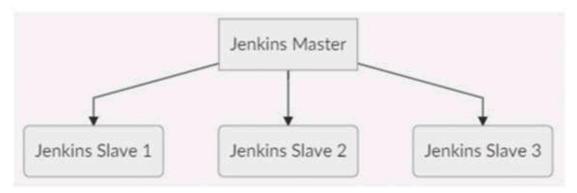

**Aim:** To understand Jenkins Master-Slave Architecture and scale your Jenkins standalone implementation by implementing slave nodes.

**Objective:** The objective of understanding Jenkins Master-Slave architecture is to comprehend how to scale Jenkins infrastructure by implementing slave nodes, thereby distributing the workload and enhancing the performance and resilience of the Jenkins CI/CD system

#### Theory:

A Jenkins master comes with the basic installation of Jenkins, and in this configuration, the master handles all the tasks for your build system. You are working on multiple projects, you may run multiple jobs on each project. Some projects need to run on some nodes, and in this process, we need to configure slaves. Jenkins slaves connect to the Jenkins master using the Java Network Launch Protocol.

Jenkins Master and Slave Architecture

The Jenkins master acts to schedule the jobs, assign slaves, and send builds slaves to execute the jobs. It will also monitor the slave state (offline or online) and get back the build result responses from slaves and the display build results on the console output. The workload of building jobs is delegated to multiple slaves.

#### **Steps:**

- 1. Click on Manage Jenkins in the left corner on the Jenkins dashboard.
- 2. Scroll down, Click on Manage Nodes and clouds.

### Department of Artificial Intelligence & Data Science

3. Select New Node and enter the name of the node in the Node Name field.

Select New Node and enter the name of the node in the Node Name field.

4. Select Permanent Agent and click the OK button. Initially, you will get only one option, "Permanent Agent." Once you have one or more slaves you will get the "Copy Existing Node" option.

Select **Permanent Agent** and click the **OK** button. Initially, you will get only one option, "Permanent Agent." Once you have one or more slaves you will get the "Copy Existing Node" option.

In the above screen shot, Parallel Agent 01 was Created and currently it is in offline mode.

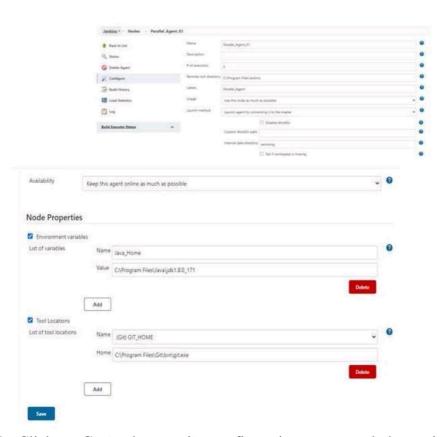

- 5. Click on configure, Provide the details.
  - 1. Name -Parallel\_Agent\_01.
  - 2. Number of executors- 5.
  - 3. Remote root directory-We have to provide a Jenkins path.
  - 4. Labels-Parallel\_Agent.
  - 5. Launch method-Launch agent by connecting it to the master.

## Department of Artificial Intelligence & Data Science

- 6. Node Properties Tab:
  - Check Environment variables
    Provide the Java path
  - Check Tool Locations
     Provide the Git path and click on save button.

7. Click on Go to the security configuration screen and change it. It will redirect to Configure Global Security → Agents > click on Fixed radio button port: 49187 and click on save Button. Go back to Nodes settings.

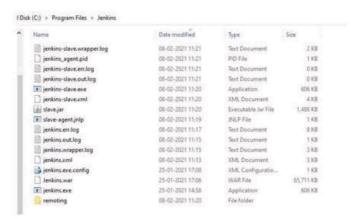

### Department of Artificial Intelligence & Data Science

- 8. We can see the screen,
  - 1. Click on Launch button, it will download the launch agent in your system.

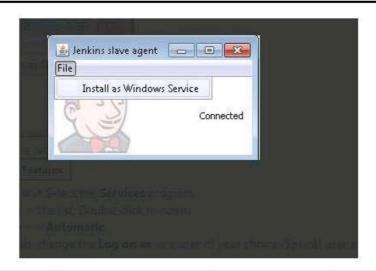

- 2. Jenkins-slave.exe file should copy in the Jenkins folder which you installed in your system.
- 3. Double Click on jenkins slave.exe.

4. Run the launch agent, click on the run button and it will show connected.

# Vidyavardhini's College of Engineering and Technology Department of Artificial Intelligence & Data Science

5. In the screenshot below, we can see the connected popup, click on the file menu, select the install as service and click yes button. Once it is done, refresh the page.

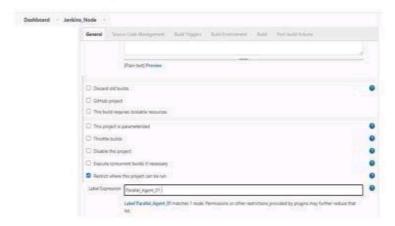

- 9. we can see the Build executors. One is master and other is Parallel\_agent\_01 In Master node, we can see the number of executors as 2.
  - In Parallel\_agent\_01, we can see the number of executors as 5.
  - Go to build job -> configure.

### Department of Artificial Intelligence & Data Science

- In the General tab, check on Restrict where this project can be run.
- In Label Expression, we have to select the node name where we need to execute the build job.

- We can create more nodes as well.

#### **Conclusion:**

Q1. How does Jenkins communicate between master and slave? Ans: Jenkins uses a Master-Slave architecture to manage distributed builds. In this architecture, Master and Slave nodes communicate through TCP/IP protocol. The main Jenkins server acts as the Master node that manages slaves.

Q2. How many slaves can be connected to Jenkins master?
